# **Results of CLEVASOL Sorbent Testing at FSUE Mayak PA**

**D.Yu. Belkin, O.M. Slyunchev, N.M. Ivenskaya**

# Test object: liquid high-level waste

Monitored parameter	Unit	Value
Cs-137	Bq/L	(2-5)·10 <sup>10</sup>
Cs-134		(2-3)·10 <sup>8</sup>
Σα		(1-100)·10 <sup>4</sup>
Σβ		(2-6)·10 <sup>10</sup>
Total dissolved solids	g/L	400-450
Al		4.3
Na		162
Fe		0.3
Cr (CrO <sub>4</sub> )		2
Ca		3
Mg		0.8
Si		0.4
NO <sub>3</sub> <sup>-</sup>		161

# CLEVASOL sorbent description

**Full capacity (min.): 5,4 meq/g (H<sup>+</sup> form)**

**Humidity: 45-55% (H<sup>+</sup> form)**

**Grain Size: 200±100 µm**

**Iron Impurity (max): 50 ppm**

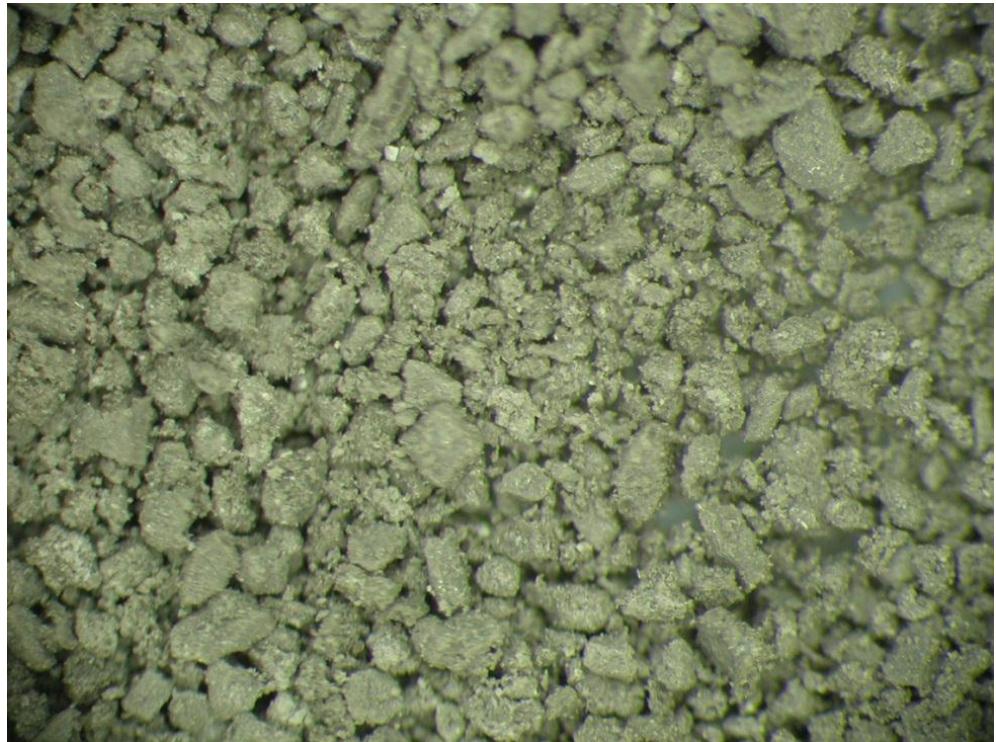

**Sodium Impurity (max): 40 ppm**

**Heavy Metall Impurity (max): 40 ppm**

**Maximum Temperature: 160 °C**

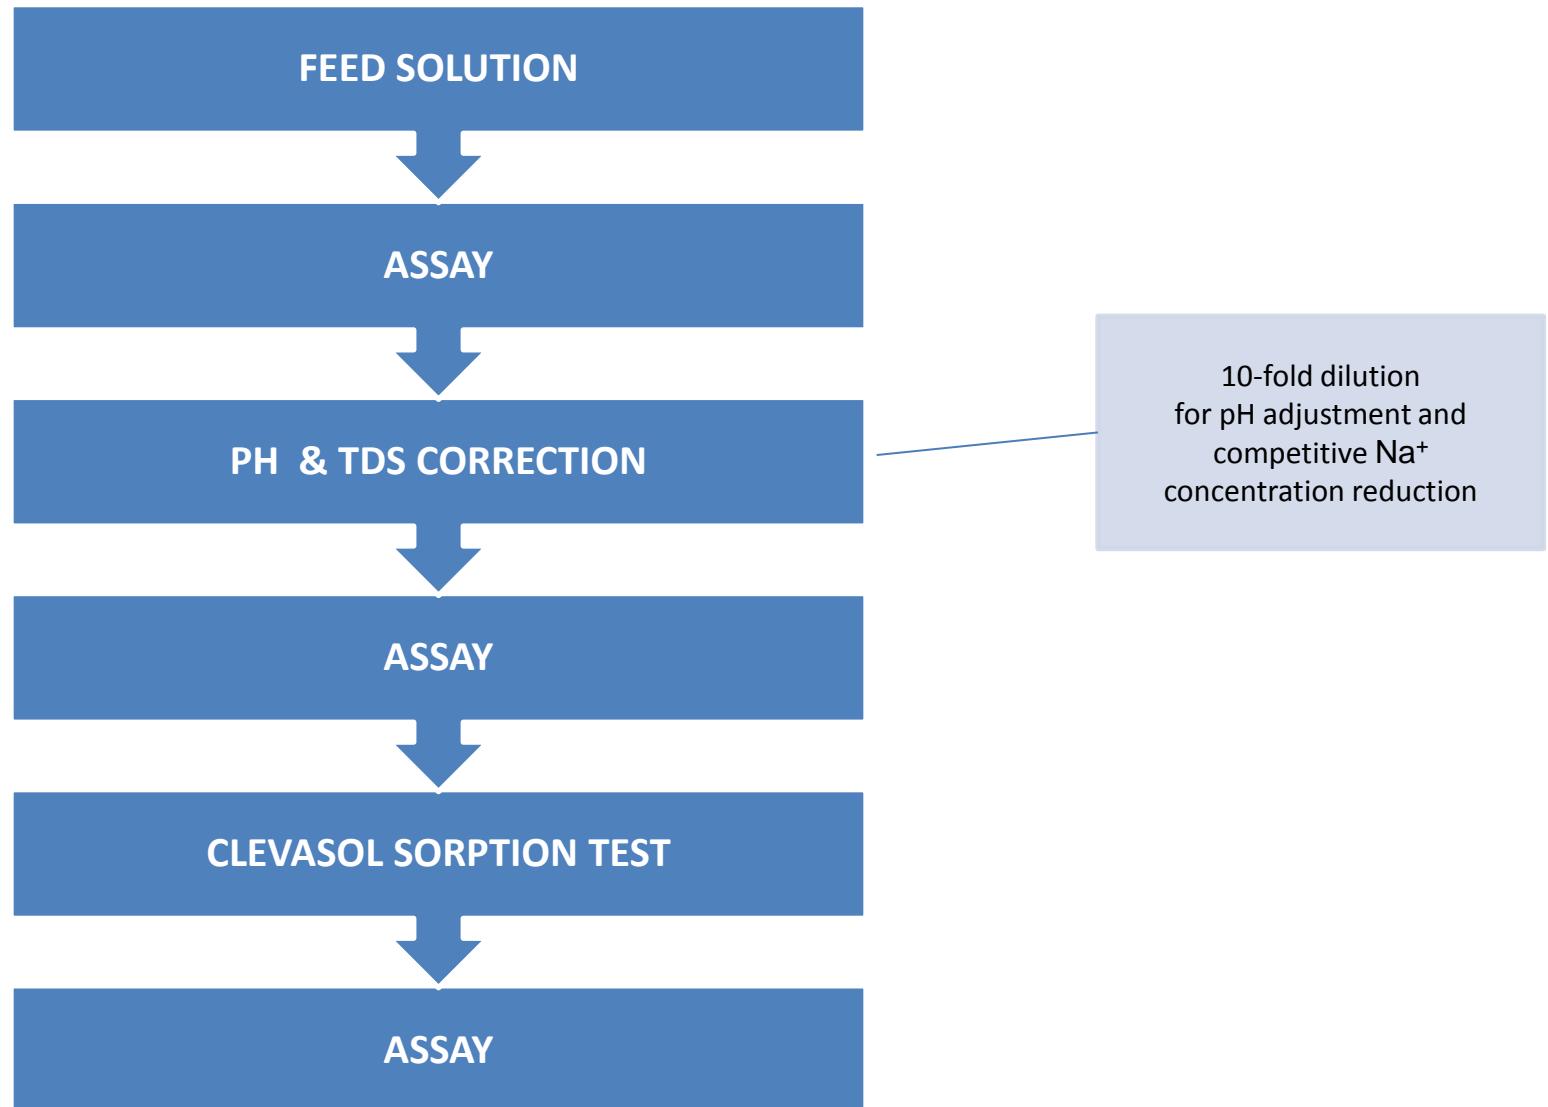

**Density (approx.) (H<sup>+</sup> form): 550 g/L**

**Insoluble in water, acids, alkalis in pH range  
from 0 to 14 and organic solvent**

# Plan of experiments

# CLEVASOL static sorption test with simulated solution

## Simulated solution

Waste Component	Concentration, mg/L			
	pH=12		pH=9	
	Feed Solution	Filtrate	Feed Solution	Filtrate
Na	9,900	3,064	8,650	5,310
Cs	5	0.281	1.9	<0.3

Solids : liquid = 1:10 Decontamination factors (DF) derived: 18 (94.4 %) for Cs

## Active solution

Waste Component	Specific activity, Bq/L			
	pH=12		pH=9	
	Feed Solution	Filtrate	Feed Solution	Filtrate
Cs-137	$4.2 \cdot 10^9$	$2.0 \cdot 10^8$	$4.2 \cdot 10^9$	$1.7 \cdot 10^9$
$\Sigma\beta$	$3.4 \cdot 10^9$	$9.4 \cdot 10^7$	$3.4 \cdot 10^9$	$1.7 \cdot 10^8$

Solids : liquid = 1:10

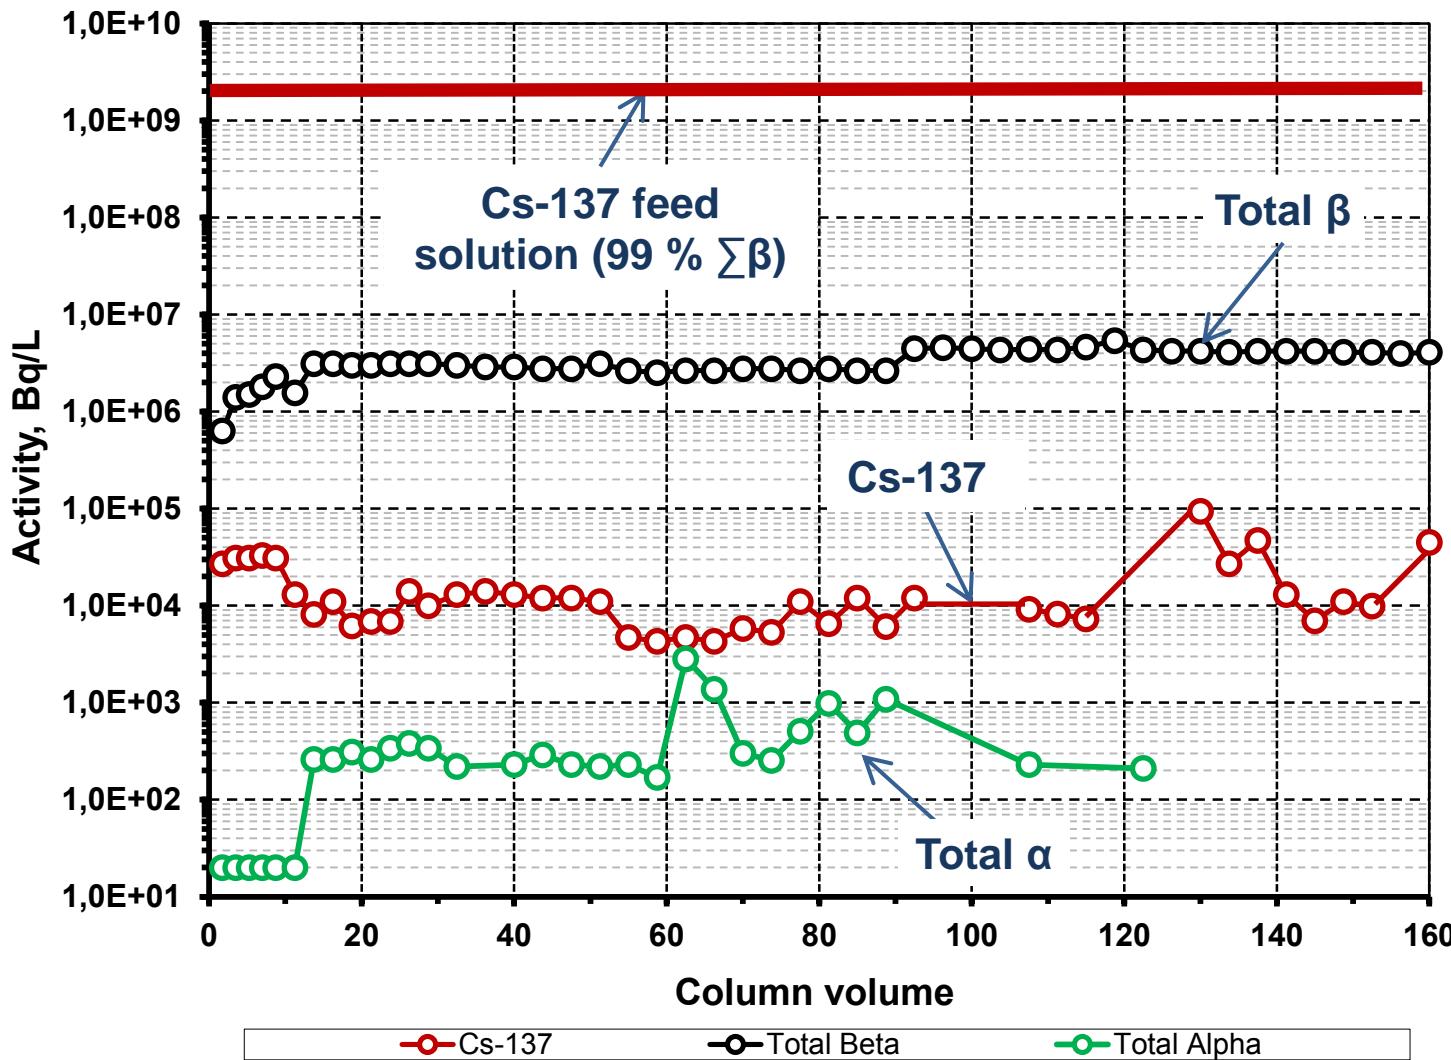

Decontamination factors (DF) derived: 21 (95.2 %) for 137Cs

36 (97.2 %) for  $\Sigma\beta$

# CLEVASOL dynamic sorption test with HLW solution (test 1)

## Feed solution

$1.7 \cdot 10^9$  Bq/L  $^{137}\text{Cs}$

$1.2 \cdot 10^7$  Bq/L  $^{134}\text{Cs}$

$6.0 \cdot 10^6$  Bq/L  $^{125}\text{Sb}$

$2.6 \cdot 10^6$  Bq/L  $^{106}\text{Ru}$

pH  $\sim 10.0$

## Averaged test results:

$\sim 7.4 \cdot 10^4$  Bq/L  $^{137}\text{Cs}$ ,  
DF = 23,000 (99.996 %)

$\sim 4,500$  Bq/L  $^{134}\text{Cs}$ ,  
DF = 2,700 (99.96 %)

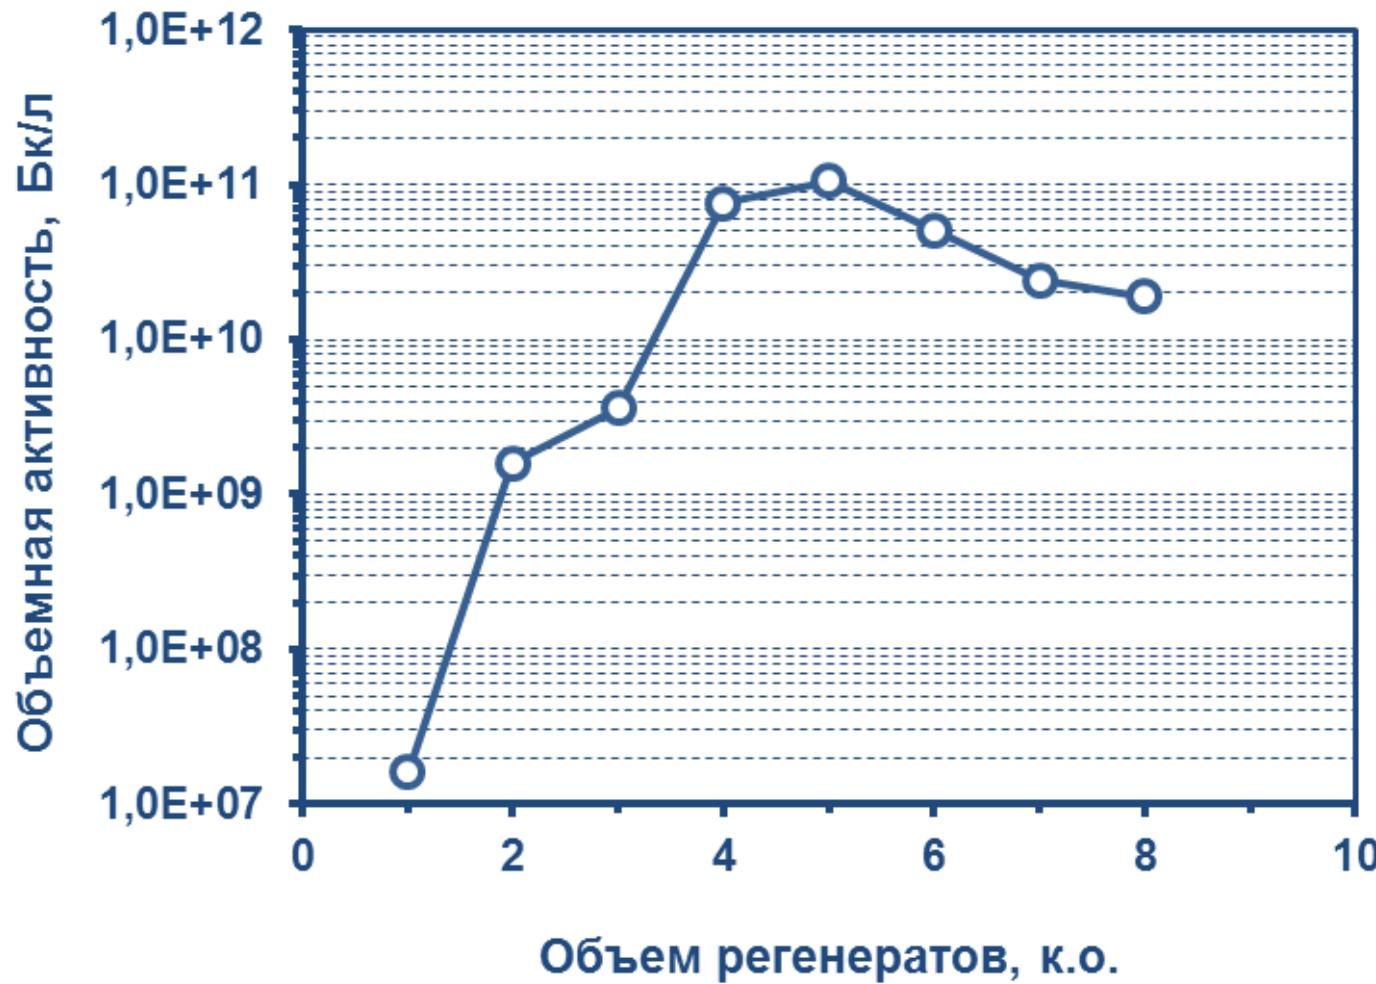

$5.4 \cdot 10^5$  Bq/L  $^{125}\text{Sb}$ ,  
DF  $\sim 11$  (91 %)

practically no  
decontamination in  
terms of  $^{106}\text{Ru}$ ,  $^{144}\text{Ce}$

## CLEVASOL regeneration (test 1)

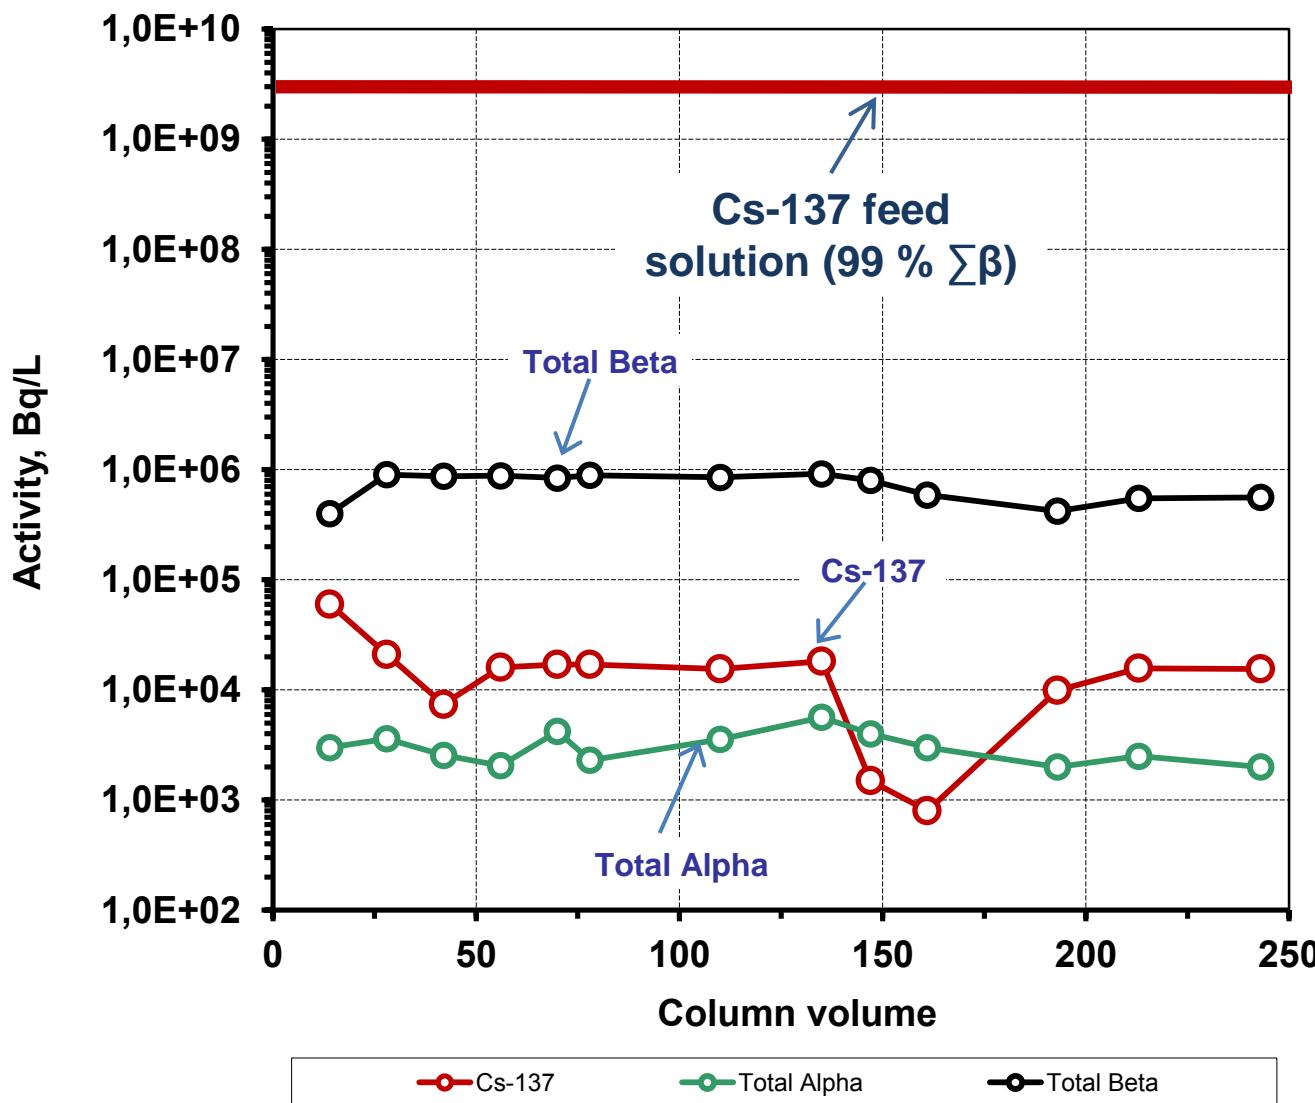

98% Cs-137 were removed with wash-off solution

Filter MED decreased from  $600 \mu\text{R}/\text{s}$  to  $10 \mu\text{R}/\text{s}$  after regeneration

# CLEVASOL dynamic sorption test with HLW solution (test 2)

## Feed solution

$4.1 \cdot 10^9$  Bq/L  $^{137}\text{Cs}$

$5.7 \cdot 10^7$  Bq/L  $^{134}\text{Cs}$

pH  $\sim 13.3$

## Averaged test results:

### Filtrate activity

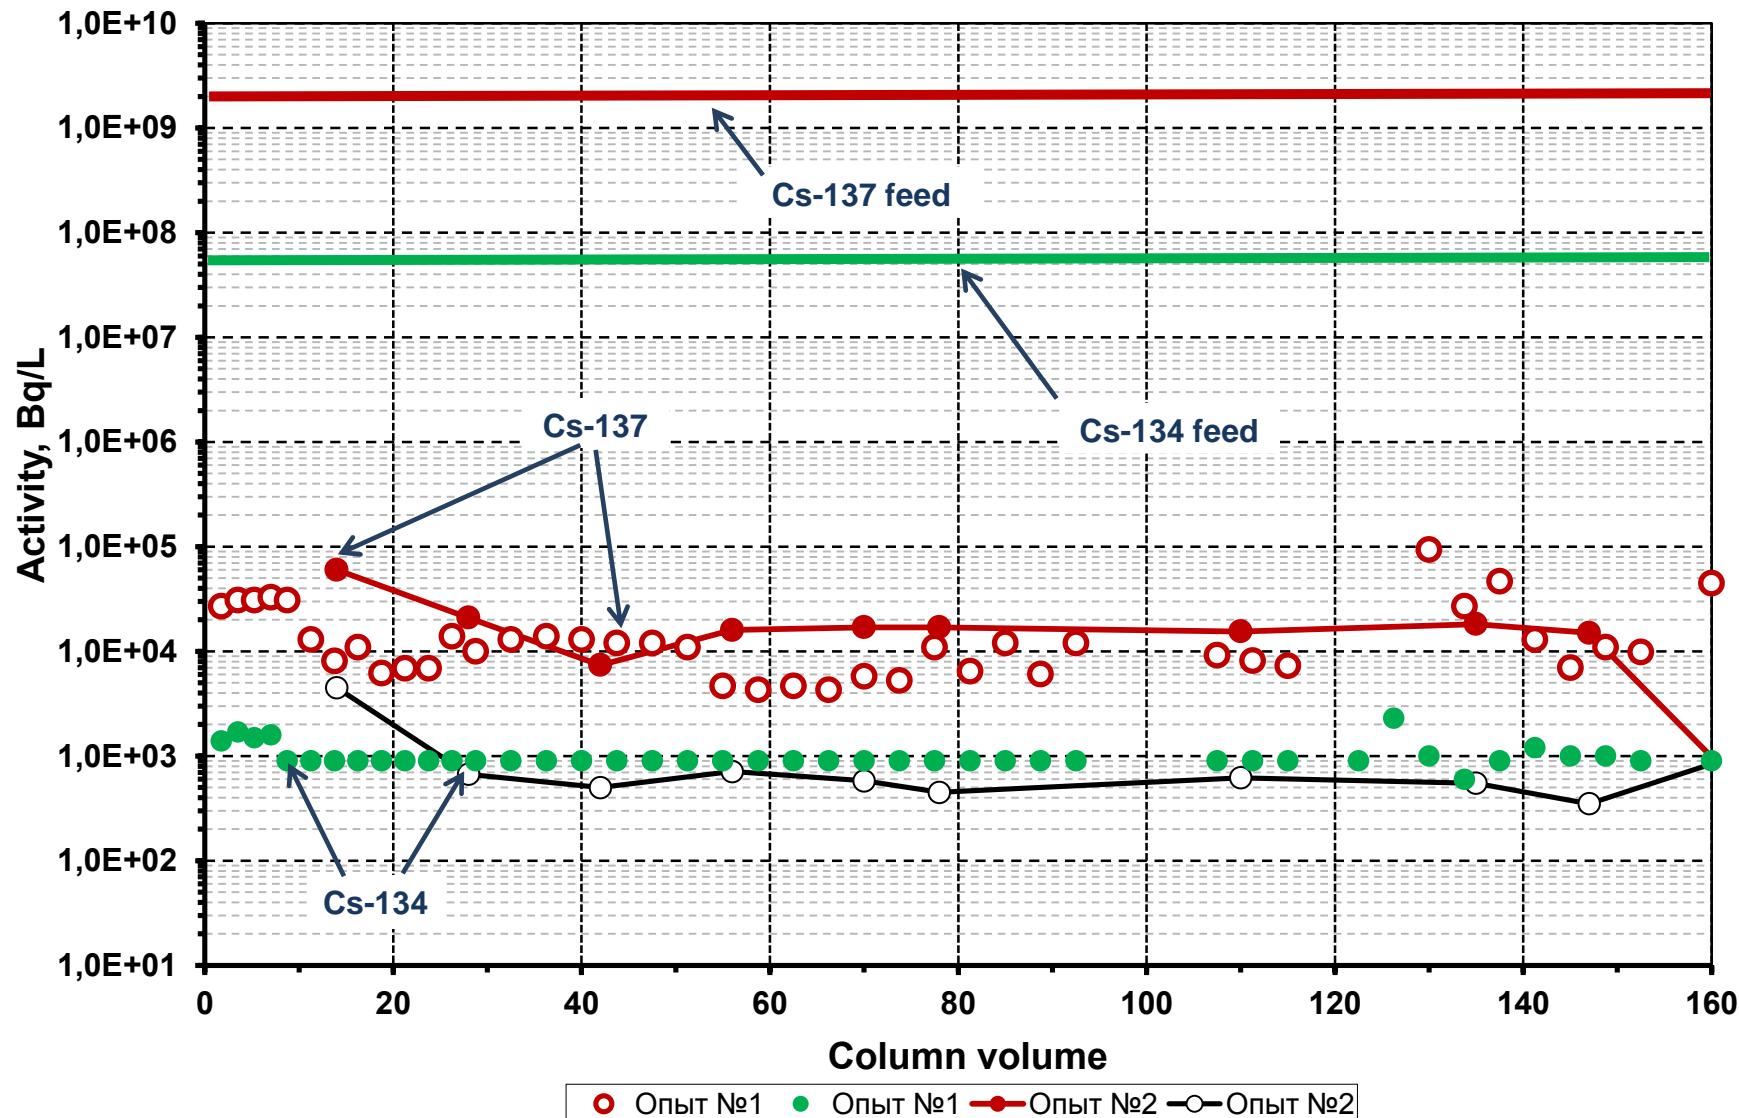

$\sim 1.8 \cdot 10^4$  Bq/L  $^{137}\text{Cs}$ ,  
DF = 300,000 (99,999%)

< 900 Bq/L  $^{134}\text{Cs}$ ,  
DF  $\sim 150,000$  (99,999 %)

# Comparison of HLW solution purification degree resulting from tests 1 and 2

# Testing results summary

Static tests	Dynamic tests	
	pH 10	pH13
Solid/liquid = 1/10	Filter cycle 160 column volumes	Filter cycle 240 column volumes
Cs-137 DF ~ 20	Cs-137 DF ~ 23,000	Cs-137 DF ~ 300,000
Contact period: one day	Filtration rate ~ 1 to 5 column volumes	Filtration rate ~ 1 to 5 column volumes
Average activity $2.0 \cdot 10^8$ Bq/L	Average activity of the filtrate $7.4 \cdot 10^4$ Bq/L	Average activity of the filtrate $1.9 \cdot 10^4$ Bq/L
$K_d = 200$	Sorbent activity $2.5 \cdot 10^8$ Bq/g (6.8 Ci/kg)	Sorbent activity $4.0 \cdot 10^8$ Bq/g (10.8 Ci/kg)

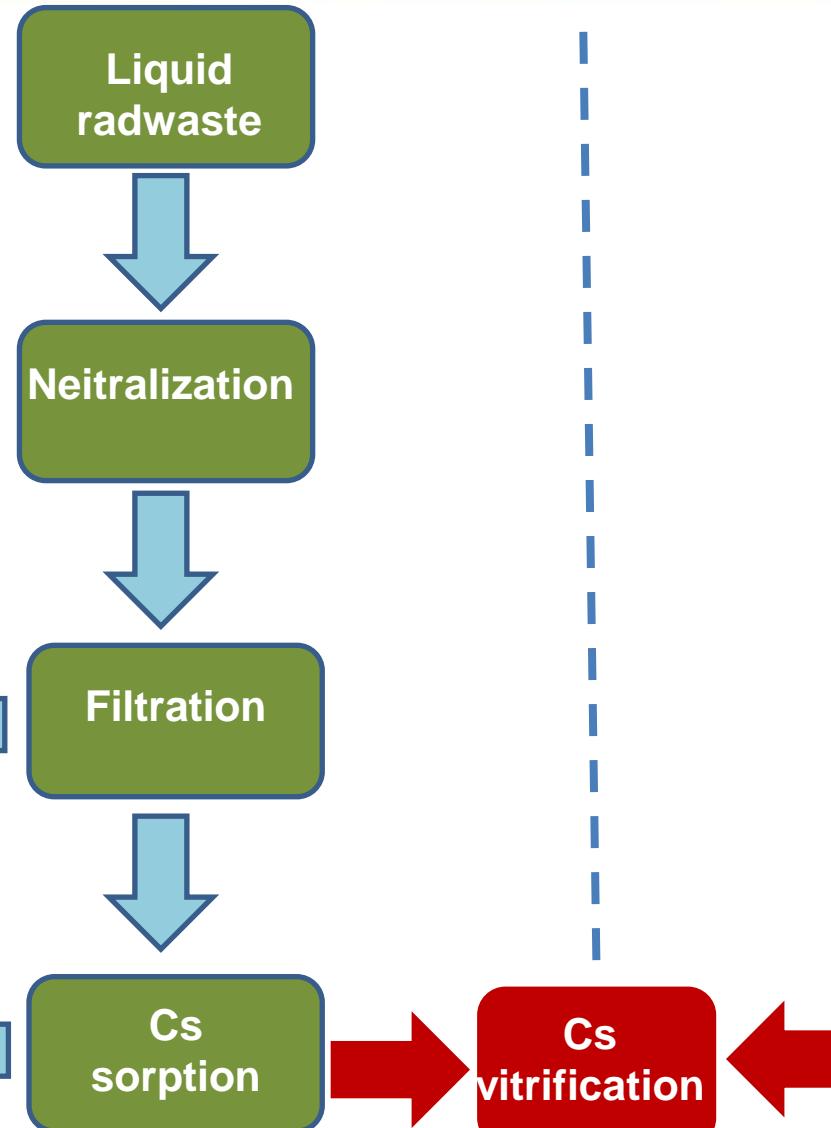

Dynamic examinations of the CLEVASOL sorbent in test 1 were terminated because of the radiation safety requirements (MED 600  $\mu$ R/s). Sorbent capacity was not completely exhausted. Dynamic examinations of the CLEVASOL sorbent in test 2 are in progress.

Dynamic tests of the CLEVASOL sorbent demonstrated decontamination factors (DF) up to  $10^6$  in terms of Cs-137.

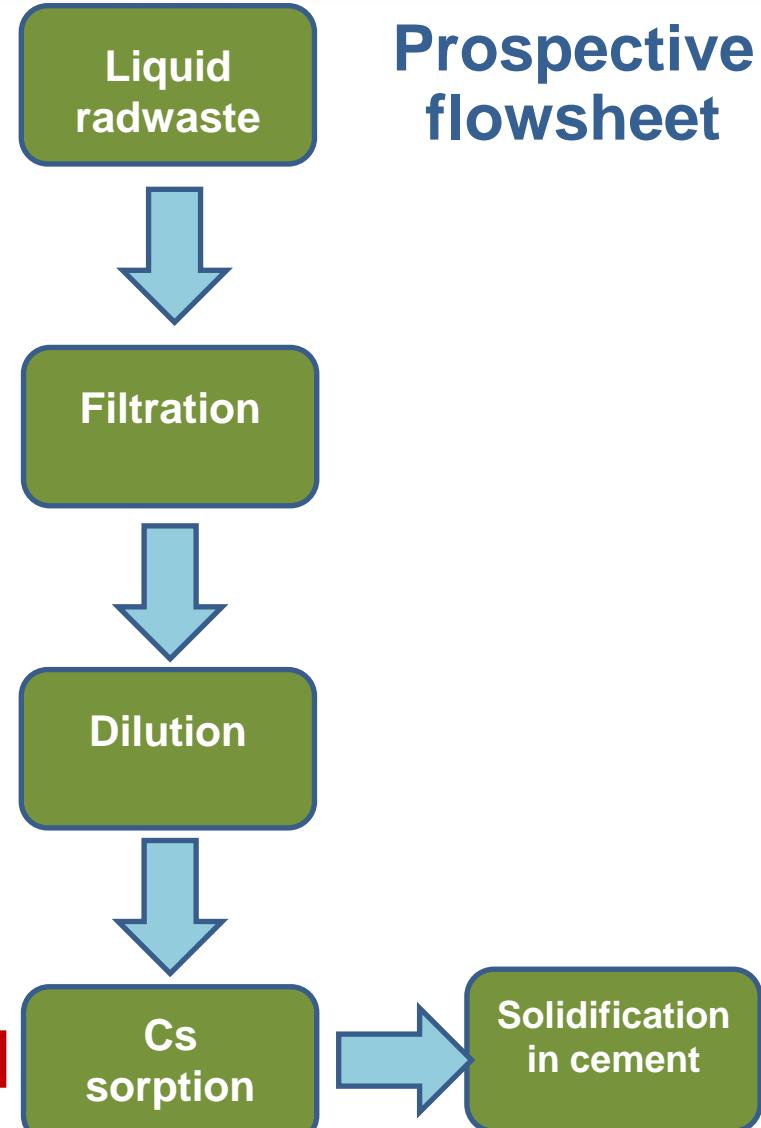

# Future sorbent application

## Design flowsheet

## Prospective flowsheet

## Conclusion

---

Preliminary results of CLEVASOL sorbent tests can be considered as quite successful. Study of CLEVASOL sorbent are to be continued to specify its features and conditions (limits) of its applicability:

- effect of interfering cations (K, NH<sub>4</sub>),
- radiation stability,
- chemical durability,
- regeneration efficiency, number of sorption/desorption cycles,
- spent sorbent management methods.

Successful implementation of the above mentioned tasks will allow large-scale reprocessing of legacy HLW.

# Thank you for your consideration!
